## 0 Document History

Version	Date	Changes	Author
1.0	18.11.2010	1 <sup>st</sup> draft	Regassa
1.1	19.11.2010	Changed format of document	Regassa
1.2	23.11.2010	Added some new screenshots	Regassa

## 1 Purpose of the Document

This short manual is intended to give a few instructions on how to start and run the Structure-FMEA analysis. It includes instructions only on the User Interfaces incorporated into the StructureFmea modules and thus does not include instructions on the other libraries incorporated into the software.

## 2 Running the Structure FMEA Demo

### 2.1 Starting StructureFMEA

Starting “StructureFMEA.exe” (double-clicking) will open the main window as shown in Figure 1. Currently the menu point “File” holds the menu items “New” and “Close” only. The menu point “New” starts a new FMEA session, whereas “Close” exits the application.

Figure 1 Structure FMEA main Window

Choose File/New to open a dialog shown in Figure 2 and enter a project number (input is required, other wise the button “Start” remains inactive). In addition, one can enter a description of the project. These inputs will be collected as log data, which can be saved as a text file at the end of the session.

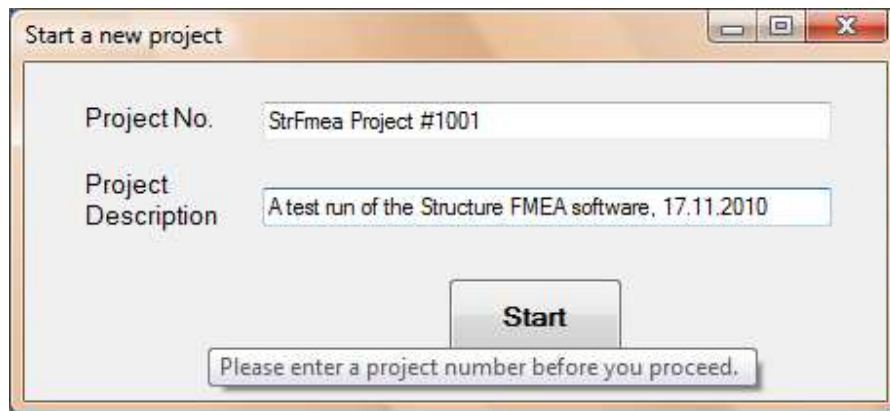

Figure 2 Clicking File/New opens this new project dialog. Input of Project Number is mandatory

## 2.2 Opening the Structural Concept

After clicking the button “Start”, the user will be prompted to open a file containing the Structural Concept. This is presumed to have the extension “.cet”. Otherwise, an error will be displayed that the file does not contain a proper Structural Concept. (Figure 4)

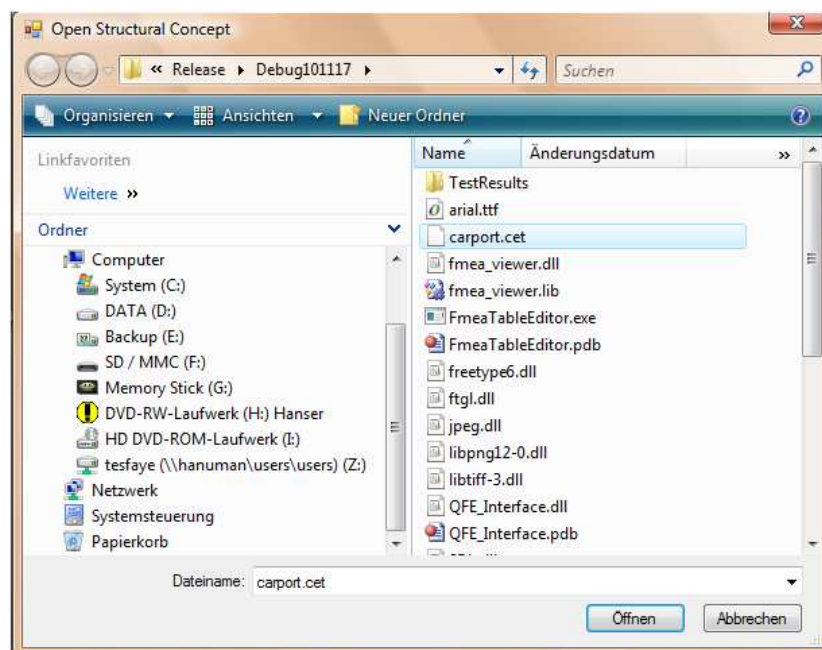

Figure 3: An Open File Dialog to open the structural concept (extension “.cet”).

Figure 4: An error report if a file to be opened does not contain a Structural concept

## 2.3 Selecting Critical Elements

Figure 5: Interaction with the Visualizer

After the Structural concept has been opened, the user is prompted 1<sup>st</sup> to choose critical fault elements, and in a second round, to choose the critical effect elements from within the Visualizer (Figure 5). (The poor contrast gray on black! should be corrected)

The button will show the text “Select Fault Elements”, respectively, “Select Effect Elements”. To choose the critical elements, the user must click the button once, upon which the button text changes to “Get Elements”. Before clicking “Get Elements”, the user has to select the desired critical elements in the Viewer. Here, it is only a mock up selection. In any way, a prepared set of fault, resp. effect elements will be returned with all their fault and effect definitions as set up for the demo.

## 2.4 Modes of Operation

After the critical elements have been retrieved successfully in background, the user is prompted to choose between a batch mode and interactive mode of operation (Figure 6). In batch mode, the FMEA analysis runs with the selected sets of Faults/FaultElements and Critical Effect Elements without user interaction.

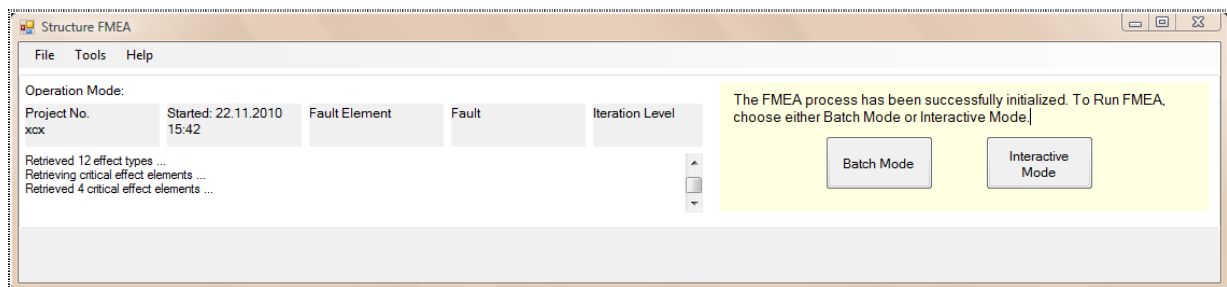

Figure 6: The user is prompted to choose a batch or an interactive mode of operation

### Interactive Mode of Operation

#### a. Selecting a Fault Element for Analysis

In an interactive mode, the user can select one FaultElement at a time from the set collected during the initialization phase (Figure 7) and run the analysis interactively. At the end of both modes of operation, the analysis results collected in the TableEditor are saved automatically.

Figure 7: Selection of a fault element for analysis

### b. Selecting display of results

In an interactive session, the user is prompted if he/she wants to view the intermediate results at the end of every iteration cycle. For that, the user can choose between the visualizer and the table editor. The user can inspect the tables viz. the visual display as long as she desires. The selected form of display remains displayed until the OK button is pressed that then closes the dialog. Thereafter, the dialog in Figure 8 reappears so that the user can switch to the other form of display. After enough inspection, the user can press “No Display” to continue with the rest of the analysis.

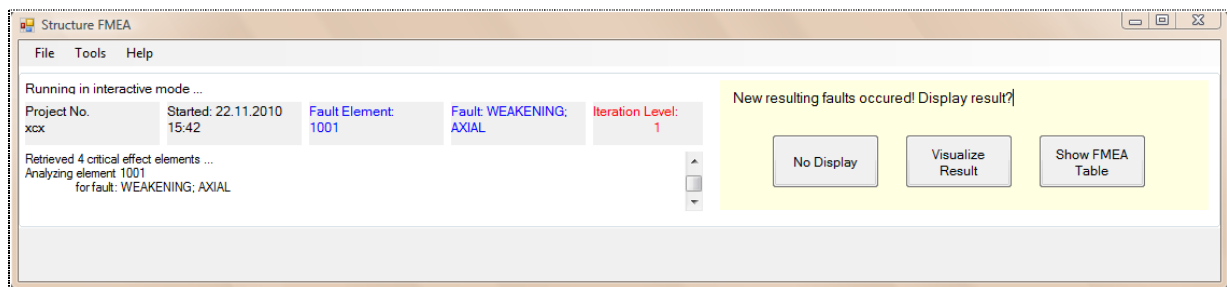

Figure 8: Selecting how to display result of an analysis

For this demo, there is no proper display of effects in the visualizer, except entries of resultant effects in a text box (Figure 9). A data structure exchanged with the Visualizer contains (element id, reaction type, location, current reaction value, change in %, resulting fault).

ID	Location	Reaction Type	Change %	Resulting Fault
1003	AXIAL	13,5	No fault	
1003	FLEXURAL_Y	20,6	No fault	

Figure 9: A text box showing resulting effects

In the table editor, attributes of the structural element acting as the CriticalFaultElement will be inserted into the respective columns in Table 1, including: row number, globally unique ID of the element, its name, function and description, type of fault, its possible cause, its local and system level effects.

Table 2 is devised as a pivot table upon rows in Table1, and contains results of the computations of actual member reactions and the associated local effects for all the critical effect elements and relevant locations in each of them.

GUID	Name	Function	Fault Type	Possible Cause	A	Remedial Action	Local Effect	System Level Effects	B	Detection Means	E	RPN	C
1001	Beam	supports	Reduction in stiffness of	Reduced section, mechanical damage or material deterioration	0		Reduced ca	Resulted in unstable	0		0	0	
1001	Beam	supports	Overstressing	Loads are more than what the section is designed for	0		Fails due to	Resulted in unstable	0		0	0	

Figure 10: View in Table Editor. Each fault of a Structural element produces one row in table 1.

NB: the Table Editor currently does not allow insertion of cell values in rows entered in a preceding cycle. Thus, the whole row can be inserted only at once. It is under revision to correct this deficiency. Since the final system level effects caused by a given initial fault can be known only at the end of some iteration cycles, a row can only be entered into table 1 after the end of all iterations with the fault. Since Table 2 is devised as a pivot table upon rows in Table 1, the detail results of analysis can only be inspected if there are entries in Table 1; i.e. only when iteration with a given fault ends.

#### c. Ending analysis of a fault

During an interactive session, the user has the option to prematurely end the iteration cycles of a given fault, for which he/she is prompted as in Figure 11. Otherwise, the iteration cycle ends if no new faults occur, or the fault results in some system level instability.

In case the selected fault element contains a number of initial faults, the user can opt to skip analysing the remaining faults in a dialog shown in Figure 12.

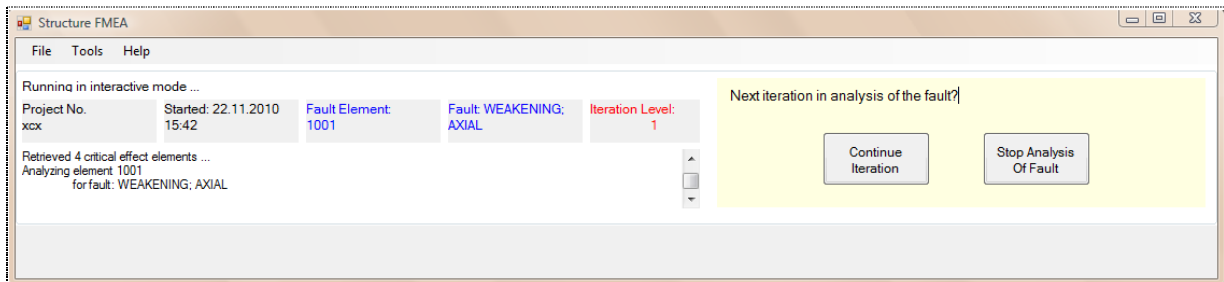

Figure 11: The user can opt to end cycles of iteration with one fault

#### d. Ending analysis of a fault element

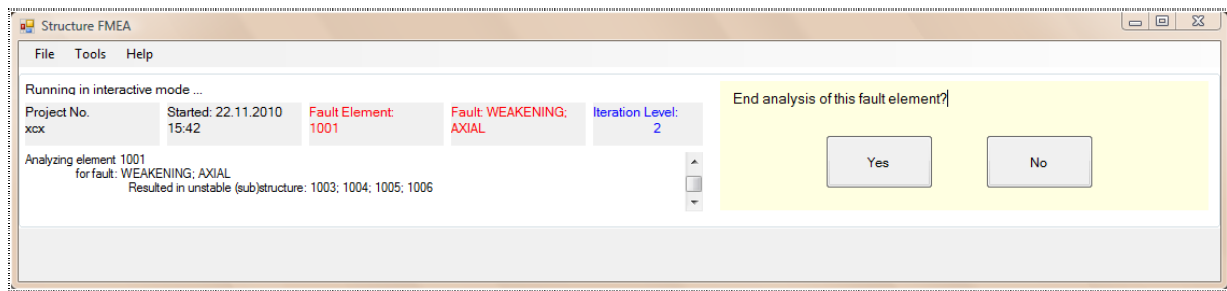

Figure 12: The user can skip analysis of remaining faults of a critical fault element

After finishing analysis of the selected FaultElement, the user is prompted if he/she wants to analyze another fault element in the set retrieved during the initialization phase (Figure 13). If the user chooses “Yes”, he/she will be presented the dialog shown in Figure 7 again. Otherwise, he/she is prompted with the reinitialization dialog shown in Figure 14.

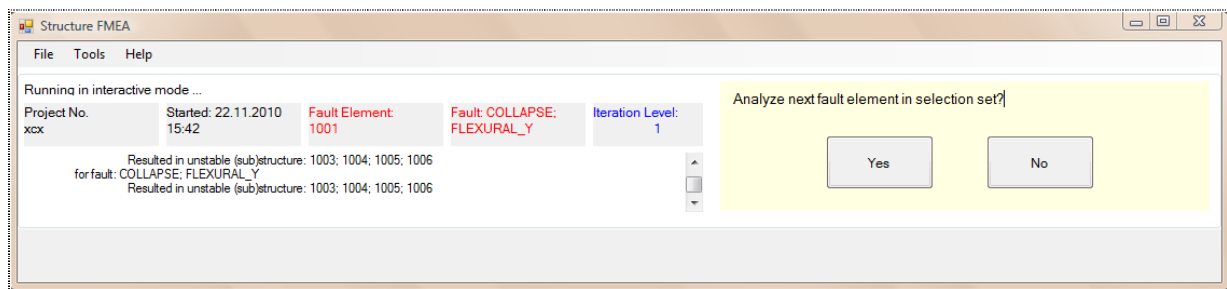

Figure 13: A user prompt (in interactive mode) for selection of next fault element

#### e. Reinitialization

The dialog in Figure 14, prompts the user for reinitialization if desired. The user can select to reinitialize (i.e. retrieve anew) either fault elements only (the effect elements will be reused), or effect elements only (the fault elements will be reused), or retrieve both anew. The procedure can then be repeated with these new sets. If the user opts for “No Initialization”, the FMEA process terminates, the results in the table editor saved automatically, and he/she will be shown the dialog in Figure 15.

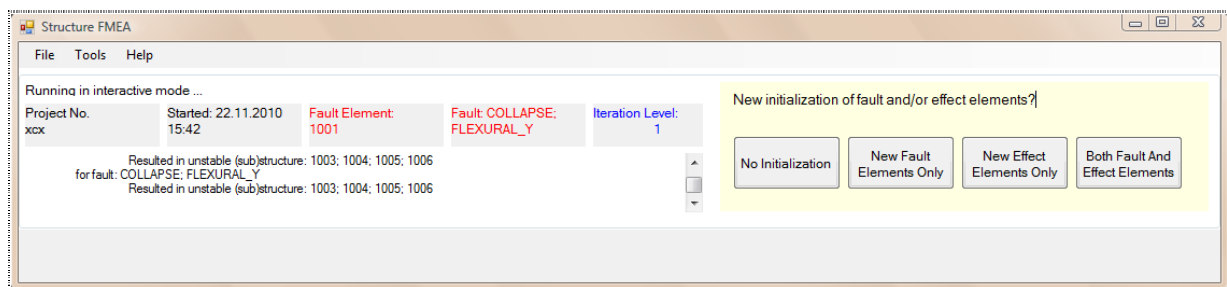

Figure 14: A dialog for reinitialization of the FMEA process with new Fault and/or Effect elements

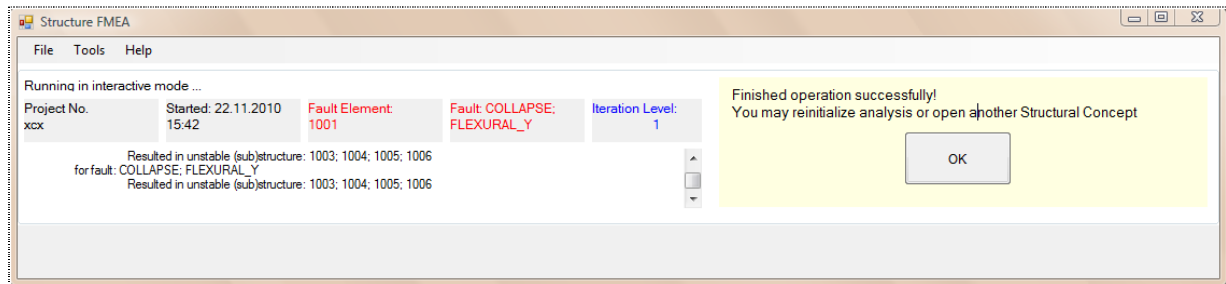

Figure 15: End of the FMEA process

In interactive mode, the user is also prompted if he/she wants to save the logging to a file.

## 2.5 Editing the Results Table

At the end, the Visualizer and the Table Editor are displayed for inspection. Figure 16 shows the details of analysis results in a table editor.

GUID	Name	Function	Fault Type	Possible Cause	A	Remedial Action	Local Effect	System Level Effects	B	Detection Means	E	RPN	Control
1001	Beam01	support	Reduction in stiffness of structural element	Reduced section, mechanical damage	0		Reduced stiffness	Resulted in unstable	0		0	0	
1001	Beam01	support	Overstressing	Loads are more than what the section is	0		Fails due to overstressing	Resulted in unstable	0		0	0	
1002	Column02	support	Reduction in stiffness of structural element	Reduced section, mechanical damage	0		Reduced stiffness	Resulted in unstable	0		0	0	

Iteration Level	Element ID	Element Name	Reaction Type	Location	Actual Value	Percentage Change	Effect	Resultant Fault	Comment
1	1003	Beam03	SHEAR_Z		102.98	21.1	Carrying capacity of the element is exhausted	Yielding	
1	1004	Column04	SHEAR_Z		106.47	25.3	Carrying capacity of the element is exhausted	Yielding	
1	1006	Column06	SHEAR_Z		114.06	34.2	Structural element collapses	Overstressing	
2	1003	Beam03	SHEAR_Z		130.1	53.1	Structural element collapses	Overstressing	
2	1004	Column04	AXIAL		-358.93	19.6	Structural element collapses	Overstressing	
2	1004	Column04	SHEAR_Z		119.81	41	Structural element collapses	Overstressing	
2	1004	Column04	TORSIONAL		92.19	84.4	Carrying capacity of the element is exhausted	Yielding	
2	1005	Beam05	SHEAR_Z		104.28	22.7	Carrying capacity of the element is exhausted	Yielding	
2	1006	Column06	SHEAR_Z		144.17	69.6	Structural element collapses	Overstressing	
2	1006	Column06	TORSIONAL		105.77	111.5	Structural element collapses	Overstressing	

Figure 16 Clicking in one of the rows in Table 1 shows the details of the analysis in lower table

The Table Editor can also be used as a stand alone application, that enables the user to open existing FMEA data, editing and saving under a different file, and printing (ToDo).
